# MILLENNIUM

1000-2000

In the 1850s Western forces opened up Japan to world trade. Japan, and most of Asia, resisted Western incursions for years. After Japan was opened, it embraced technology and became a major industrial power.

The invention of the elevator allowed building to become taller and allowed for the explosive growth of major cities upward.

The Bessemer process of steel production allowed for building projects like skyscrapers and large ships, which were impossible with existing iron techniques.

After witnessing the horrors of the Crimean War, Florence Nightingale founded the profession of nursing in order to provide decent medical care. She would later suffer from post-traumatic stress disorder.

Frenchman Louis Pasteur discovered that disease was caused by germs. He also developed the idea of heating milk, and other food products, in order to kill germs and make food safe.

In 1859 Edwin Drake drilled the first oil well in Titusville, Pennsylvania, USA. This discovery sounded the death knell of the whaling industry which had been supplying oil paved the way for the industrial revolution and its machines which needed oil to operate efficiently.

After his trip around the world in the 1830s, Charles Darwin worked for years on the material he collected. He formed his theory of evolution and published it in 1859.

In 1866 the obscure monk Gregor Mendel did a series of experiments showing him the mechanics of heredity. Though published at the time his work was not "discovered" by the scientific community until 1900.

In 1907 Mrs. T. S. Arthur of the South...

# TOWARDS THE CHINESE LUNAR YEAR OF THE GOAT

The domestic goat (*Capra aegagrus*) is the wild goat of southwest Asia. Goats are one of the most common farm animals.

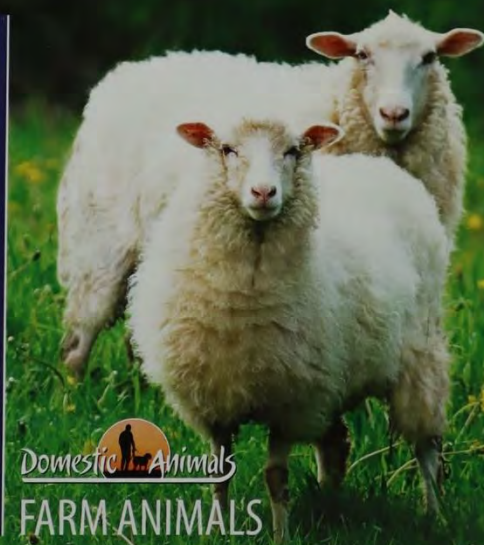

# TOWARDS THE CHINESE LUNAR YEAR OF THE GOAT

Farm animals are domesticated animals, raised in an agricultural setting to serve the provisional and labor needs of their owners. Animal domestication has its origins in the transition of the human civilisation from hunter-gatherer lifestyles to settled farming communities. The breeding and conditions of such animals are entirely by humans and most are unsuited to life in the wild.

# FARM ANIMALS

# FARM ANIMALS

A falcon is any one of 37 species of raptor in the genus *Falco*, widely distributed on all continents of the world. Adult falcons have thin tapered wings, which enable them to fly at high speed and to change direction rapidly. Fledgling falcons, in their first year of flying, have longer flight feathers, which makes their configuration more like that of a general-purpose bird such as a broadwing. This makes it easier to fly while learning the exceptional skills required to be effective hunters as adults.

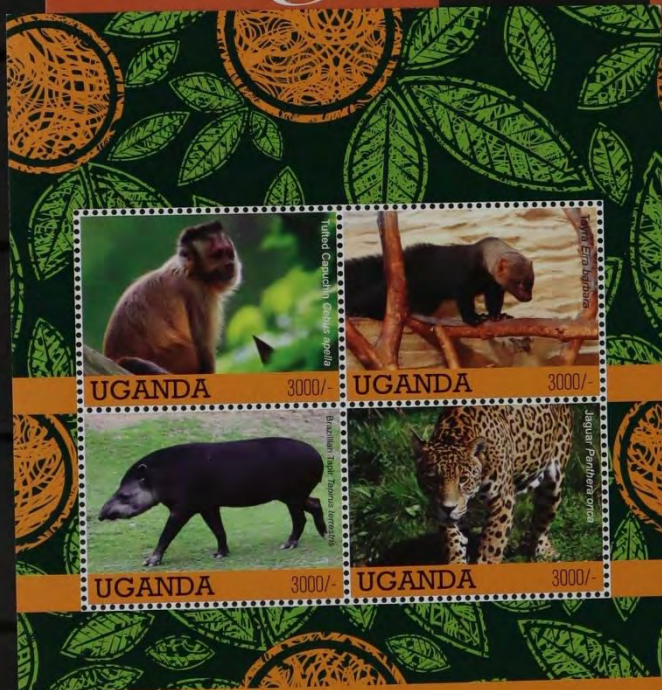

Parrots, also known as psittacines, are birds of the roughly 372 species in 86 genera that make up the order Psittaciformes, found in most tropical and subtropical regions. The order is subdivided into three superfamilies: the Psittacoidea ('true' parrots), the Cacatuoidea (cockatoos) and the
